A water trough which is 10 metres long has a uniform cross-section in the shape of a semicircle with radius 0.5 metres. It is partly filled with water as shown in the following diagram of the cross-section. The centre of the circle is O and the angle KOL is θ radians.

diagram not to scale

- 1a. Find an expression for the volume of water V (m^3) in the trough in terms of θ . [3 marks]

2. A camera at point C is 3 m from the edge of a straight section of road as [6 marks] shown in the following diagram. The camera detects a car travelling along the road at $t = 0$. It then rotates, always pointing at the car, until the car passes O, the point on the edge of the road closest to the camera.

A car travels along the road at a speed of 24ms^{-1} . Let the position of the car be X and let $\text{O}\hat{\text{C}}\text{X} = \theta$.

Find $\frac{d\theta}{dt}$, the rate of rotation of the camera, in radians per second, at the instant the car passes the point O .

A large rectangular box containing 20 horizontal dotted lines, intended for writing or drawing.

Two boats A and B travel due north.

Initially, boat B is positioned 50 metres due east of boat A.

The distances travelled by boat A and boat B, after t seconds, are x metres and y metres respectively. The angle θ is the radian measure of the bearing of boat B from boat A. This information is shown on the following diagram.

diagram not to scale

3a. Show that $y = x + 50 \cot \theta$.

3b. At time T , the following conditions are true.

[6 marks]

Boat B has travelled 10 metres further than boat A.

Boat B is travelling at double the speed of boat A.

The rate of change of the angle θ is -0.1 radians per second.

Find the speed of boat A at time T .
