Interest rates

There are two types of interest rates: **simple interest** and **compound interest**. Both may appear on the exam, but vast majority of the questions are on the compound interest.

Simple interest

Fixed amount is added each period.

Compound interest

Fixed percentage is added each period.

Simple interest

In simple interest fixed amount is added each period.

If we invest 1000 PLN in a fund that pays 5% simple interest per year, it means that we will get 50 PLN (because 5% of 1000 PLN is 50 PLN) each year. So after 5 years we will have $1000 \pm 5 \cdot 50 = 1250$ PLN.

Simple interest

In **simple interest** fixed amount is added each period.

If we invest 1000 PLN in a fund that pays 5% simple interest per year, it means that we will get 50 PLN (because 5% of 1000 PLN is 50 PLN) each year. So after 5 years we will have $1000+5\cdot50=1250$ PLN.

4 / 43

Simple interest - exercise

Tomasz invests 20000 PLN into savings account that pays 6% simple interest per year. Find the value of his investment after 7 years.

 $6\% \cdot 20000 = 120$

So he gets 120 PLN each year

After 7 years his investment will be worth:

 $20000 + 7 \cdot 120 = 28400$

Tomasz Lechowski DP1 AI HL September 16, 2023 5 / 43

Simple interest - exercise

Tomasz invests 20000 PLN into savings account that pays 6% simple interest per year. Find the value of his investment after 7 years.

$$6\% \cdot 20000 = 120$$

So he gets 120 PLN each year.

Arter / years his investment will be worth.

Simple interest - exercise

Tomasz invests 20000 PLN into savings account that pays 6% simple interest per year. Find the value of his investment after 7 years.

$$6\% \cdot 20000 = 120$$

So he gets 120 PLN each year.

After 7 years his investment will be worth:

$$20000 + 7 \cdot 120 = 28400$$

5 / 43

In compound interest fixed percentage is added each period.

If we invest 1000 PLN in a fund that pays 5% compound interest (compounded annually), it means that we will get 50 PLN (because 5% of 1000 PLN is 50 PLN) after the first year, but we will get 52.5 PLN (because 5% of 1050 PLN is 52.5 PLN) in the second year and the amount we receive increases as we have more money in the account.

Because the amount we have increases by a fixed percentage, we can multiply it by 1.05 each year. Note that multiplying by 1.05 denotes the increase by 5%.

So after 5 vears we will have:

 $1000 \cdot 1.05^{\circ} = 1276.28$

In **compound interest** fixed percentage is added each period.

If we invest 1000 PLN in a fund that pays 5% compound interest (compounded annually), it means that we will get 50 PLN (because 5% of 1000 PLN is 50 PLN) after the first year, but we will get 52.5 PLN (because 5% of 1050 PLN is 52.5 PLN) in the second year and the amount we receive increases as we have more money in the account.

In **compound interest** fixed percentage is added each period.

If we invest 1000 PLN in a fund that pays 5% compound interest (compounded annually), it means that we will get 50 PLN (because 5% of 1000 PLN is 50 PLN) after the first year, but we will get 52.5 PLN (because 5% of 1050 PLN is 52.5 PLN) in the second year and the amount we receive increases as we have more money in the account.

Because the amount we have increases by a fixed percentage, we can multiply it by 1.05 each year.

In **compound interest** fixed percentage is added each period.

If we invest 1000 PLN in a fund that pays 5% compound interest (compounded annually), it means that we will get 50 PLN (because 5% of 1000 PLN is 50 PLN) after the first year, but we will get 52.5 PLN (because 5% of 1050 PLN is 52.5 PLN) in the second year and the amount we receive increases as we have more money in the account.

Because the amount we have increases by a fixed percentage, we can multiply it by 1.05 each year. Note that multiplying by 1.05 denotes the increase by 5%.

In **compound interest** fixed percentage is added each period.

If we invest 1000 PLN in a fund that pays 5% compound interest (compounded annually), it means that we will get 50 PLN (because 5% of 1000 PLN is 50 PLN) after the first year, but we will get 52.5 PLN (because 5% of 1050 PLN is 52.5 PLN) in the second year and the amount we receive increases as we have more money in the account.

Because the amount we have increases by a fixed percentage, we can multiply it by 1.05 each year. Note that multiplying by 1.05 denotes the increase by 5%.

So after 5 years we will have:

 $1000 \cdot 1.05^5 = 1276.28$

6 / 43

Tomasz invests 50000 PLN into savings accound that pays 3% annual interest compounded yearly. Calculate the value of his investment after 8 years.

 $50000 \cdot 1.03^{\circ} = 63338.50$

We multiplied by 1.03 to denote the 3% increase. 1.03 is to the 8th power

because we want to know the value of the investment after 8 years

Tomasz invests 50000 PLN into savings accound that pays 3% annual interest compounded yearly. Calculate the value of his investment after 8 years.

$$50000 \cdot 1.03^8 = 63338.50$$

We multiplied by 1.03 to denote the 3% increase. 1.03 is to the 8th powe

because we want to know the value of the investment after 8 years

Tomasz Lechowski DP1 Al HL September 16, 2023 7 / 43

Tomasz invests 50000 PLN into savings accound that pays 3% annual interest compounded yearly. Calculate the value of his investment after 8 years.

$$50000 \cdot 1.03^8 = 63338.50$$

We multiplied by 1.03 to denote the 3% increase. 1.03 is to the 8th power because we want to know the value of the investment after 8 years.

To solve compound interest problems on **Ti-84** you need to press APPS and find Finance.

8 / 43

When using GDC you need to input the following data:

n - number of periods/payments,

1% - annual interest rate,

PV - present value,

PMT - payments,

FV - future value,

P/Y - payments (or periods) per year,

C/Y - compounding per year.

When using GDC you need to input the following data:

n - number of periods/payments,

1% - annual interest rate,

PV - present value,

PMT - payments,

FV - future value.

P/Y - payments (or periods) per year,

C/Y - compounding per year.

Note that we use sign (+ or -) to indicate the direction of the money. For example -1000 means that we lose (or invest) the money, +1000 means that we get (or borrow, or withdraw) the money.

```
In our example we have  \begin{array}{l} n=8 \mbox{ (our period is a year and we want 8 years)} \\ I\%=3 \\ PV=-50000 \mbox{ (minus sign indicates that we invest this money)} \\ PMT=0 \mbox{ (there are no payments)} \\ FV=? \mbox{ (this doesn't matter, we need find it)} \\ P/Y=1 \mbox{ (there is one year in a year)} \\ C/Y=1 \mbox{ (it is compounded once a year)} \\ \end{array}
```

```
In our example we have
   n = 8 (our period is a year and we want 8 years)
  1\% = 3
  PV = -50000 (minus sign indicates that we invest this money)
PMT = 0 (there are no payments)
  FV = ? (this doesn't matter, we need find it)
P/Y = 1 (there is one year in a year)
C/Y = 1 (it is compounded once a year)
 You need to highlight FV and press ALPHA-ENTER (Solve).
```

```
In our example we have
   n = 8 (our period is a year and we want 8 years)
  1\% = 3
  PV = -50000 (minus sign indicates that we invest this money)
PMT = 0 (there are no payments)
  FV = ? (this doesn't matter, we need find it)
P/Y = 1 (there is one year in a year)
C/Y = 1 (it is compounded once a year)
 You need to highlight FV and press ALPHA-ENTER (Solve).
 You should get FV = 63338.50
```

Let's consider a different example.

Tomasz invests 20000 PLN. The bank pays 4% annual interest rate and the interest is compounded every 6 months. Calculate the value of the investment after 7 years.

The annual interest rate is 4%, but it is compounded twice a year, so every 6 months we receive 2%. In 7 years there are 14 6-month periods, so we can calculate the value of the investment as follows:

 $20000 \cdot 1.02^{14} = 26389.58$

11 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

Let's consider a different example.

Tomasz invests 20000 PLN. The bank pays 4% annual interest rate and the interest is compounded every 6 months. Calculate the value of the investment after 7 years.

20000 1 02¹⁴ - 26220 52

Let's consider a different example.

Tomasz invests 20000 PLN. The bank pays 4% annual interest rate and the interest is compounded every 6 months. Calculate the value of the investment after 7 years.

The annual interest rate is 4%, but it is compounded twice a year, so every 6 months we receive 2%.

Let's consider a different example.

Tomasz invests 20000 PLN. The bank pays 4% annual interest rate and the interest is compounded every 6 months. Calculate the value of the investment after 7 years.

The annual interest rate is 4%, but it is compounded twice a year, so every 6 months we receive 2%. In 7 years there are 14 6-month periods, so we can calculate the value of the investment as follows:

$$20000 \cdot 1.02^{14} = 26389.58$$

Doing the same calculation using TVM on GDC:

```
n = 14 (we have 14 6-month periods)
```

$$1\% = 4$$
 (this is the annual interest rate)

$$PV = -20000$$
 (remember about the minus sign)

```
PMT = 0 (there are no payments)
```

$$P/Y = 2$$
 (there are 2 6-month periods in a year)

$${\sf C/Y}\,=2$$
 (the interest is compounded twice a year)

We get FV = 26389.58

12 / 43

Doing the same calculation using TVM on GDC:

```
n = 14 (we have 14 6-month periods)
```

1% = 4 (this is the annual interest rate)

PV = -20000 (remember about the minus sign)

PMT = 0 (there are no payments)

FV = ? (this is what we're looking for)

P/Y = 2 (there are 2 6-month periods in a year)

C/Y = 2 (the interest is compounded twice a year)

We get FV = 26389.58

Doing the same calculation using TVM on GDC:

```
n = 14 (we have 14 6-month periods)
```

$$1\% = 4$$
 (this is the annual interest rate)

$$PV = -20000$$
 (remember about the minus sign)

$$PMT = 0$$
 (there are no payments)

$$FV = ?$$
 (this is what we're looking for)

$$P/Y = 2$$
 (there are 2 6-month periods in a year)

$$C/Y = 2$$
 (the interest is compounded twice a year)

Tomasz invests 40000 PLN. The bank pays r% annual interest rate and compounded monthly. Calculate r if after 5 years the value of the investment is 45320.04 PLN.

understand what is happening here. The 12 in the denominator comes from the fact that we are looking for annual interest rate, but since it is compounded monthly than each month we get $\frac{1}{12}\%$. It is, of course, much assign to simply use TVM on GDC.

Tomasz invests 40000 PLN. The bank pays r% annual interest rate and compounded monthly. Calculate r if after 5 years the value of the investment is 45320.04 PLN.

We can try solving this algebraically by solving the following equation:

$$45320.04 = 40000 \cdot \left(1 + \frac{r}{12 \cdot 100}\right)^{60}$$

Tomasz invests 40000 PLN. The bank pays r% annual interest rate and compounded monthly. Calculate r if after 5 years the value of the investment is 45320.04 PLN.

We can try solving this algebraically by solving the following equation:

$$45320.04 = 40000 \cdot \left(1 + \frac{r}{12 \cdot 100}\right)^{60}$$

We should get r = 2.50.

Tomasz invests 40000 PLN. The bank pays r% annual interest rate and compounded monthly. Calculate r if after 5 years the value of the investment is 45320.04 PLN.

We can try solving this algebraically by solving the following equation:

$$45320.04 = 40000 \cdot \left(1 + \frac{r}{12 \cdot 100}\right)^{60}$$

We should get r = 2.50. Think about this equation. It helps if you understand what is happening here.

Tomasz invests 40000 PLN. The bank pays r% annual interest rate and compounded monthly. Calculate r if after 5 years the value of the investment is 45320.04 PLN.

We can try solving this algebraically by solving the following equation:

$$45320.04 = 40000 \cdot \left(1 + \frac{r}{12 \cdot 100}\right)^{60}$$

We should get r=2.50. Think about this equation. It helps if you understand what is happening here. The 12 in the denominator comes from the fact that we are looking for annual interest rate, but since it is compounded monthly than each month we get $\frac{r}{12}\%$.

Tomasz invests 40000 PLN. The bank pays r% annual interest rate and compounded monthly. Calculate r if after 5 years the value of the investment is 45320.04 PLN.

We can try solving this algebraically by solving the following equation:

$$45320.04 = 40000 \cdot \left(1 + \frac{r}{12 \cdot 100}\right)^{60}$$

We should get r = 2.50. Think about this equation. It helps if you understand what is happening here. The 12 in the denominator comes from the fact that we are looking for annual interest rate, but since it is compounded monthly than each month we get $\frac{r}{12}$ %. It is, of course, much easier to simply use TVM on GDC.

We have:

```
n = 60 (we have 60 months in 5 years)
```

$$1\% = ?$$
 (unknown)

$$PV = -40000$$
 (remember about the minus sign)

$$PMT = 0$$
 (there are no payments)

$$FV = 45320.04$$
 (no minus here, we're getting this money)

```
P/Y = 12 (12 months in a year)
```

$$C/Y = 12$$
 (interest is compounded 12 times a year)

We get that the interest rate is r=2.50

14 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

```
We have:  n = 60 \text{ (we have 60 months in 5 years)} 
 I\% = ? \text{ (unknown)} 
 PV = -40000 \text{ (remember about the minus sign)} 
 PMT = 0 \text{ (there are no payments)} 
 FV = 45320.04 \text{ (no minus here, we're getting this money)} 
 P/Y = 12 \text{ (12 months in a year)} 
 C/Y = 12 \text{ (interest is compounded 12 times a year)}
```

```
We have:
   n = 60 (we have 60 months in 5 years)
  1\% = ? (unknown)
  PV = -40000 (remember about the minus sign)
PMT = 0 (there are no payments)
  FV = 45320.04 (no minus here, we're getting this money)
P/Y = 12 (12 months in a year)
C/Y = 12 (interest is compounded 12 times a year)
 We get that the interest rate is r = 2.50.
```

Tomasz would like to have 100 000 PLN on his account in 10 years time. How much does he need to invest into savings account that pays an interest of 2% compounded quarterly?

```
Algebraically we would do it as follows:
```

```
100000 = \times \cdot (1.005)^{40}
```

We multiply by 1.005 because we earn 0.5% per quarter. The power is 40 because we have 40 quarters in 10 years. The answer we get is

x = 81913.89

Tomasz would like to have 100 000 PLN on his account in 10 years time. How much does he need to invest into savings account that pays an interest of 2% compounded quarterly?

Algebraically we would do it as follows:

$$100000 = x \cdot (1.005)^{40}$$

because we have 40 quarters in 10 years. The answer we get is

September 16, 2023

Tomasz would like to have 100 000 PLN on his account in 10 years time. How much does he need to invest into savings account that pays an interest of 2% compounded quarterly?

Algebraically we would do it as follows:

$$100000 = x \cdot (1.005)^{40}$$

We multiply by 1.005 because we earn 0.5% per quarter. The power is 40, because we have 40 quarters in 10 years. The answer we get is x=81913.89.

Now let's use TVM:

$$1\% = 2$$
 (annual interest rate)

$$^{9}MT = 0$$
 (there are no navments)

$$FV = 100 000$$
 (we want to have this much)

$$P/Y = 4$$
 (4 quarters in a year)

Tomasz Lechowski

$$C/Y = 4$$
 (compounded 4 times a year)

DP1 AI HL

Now let's use TVM:

```
n = 40 (we have 40 quarters in 10 years)
```

1% = 2 (annual interest rate)

PV = ? (this will be negative)

PMT = 0 (there are no payments)

FV = 100 000 (we want to have this much)

P/Y = 4 (4 quarters in a year)

C/Y = 4 (compounded 4 times a year)

We get that PV = -81913.89. So he should invest 81913.89 PLN. Do not use the negative sign in your final answer.

Now let's use TVM:

```
n = 40 (we have 40 quarters in 10 years)
```

$$1\% = 2$$
 (annual interest rate)

$$PV = ?$$
 (this will be negative)

$$PMT = 0$$
 (there are no payments)

$$FV = 100 000$$
 (we want to have this much)

$$P/Y = 4$$
 (4 quarters in a year)

$$C/Y = 4$$
 (compounded 4 times a year)

We get that PV = -81913.89. So he should invest 81913.89 PLN. Do not use the negative sign in your final answer.

Note that in all examples so far we've set PMT = 0 as there were no payments made during the investment.

PMT is any money that is paid in or withdrawn during the investmentt

Note that in the IB examination payments will always be made at the encode of the period. So make sure you have Payment: END.

Note that in all examples so far we've set PMT = 0 as there were no payments made during the investment.

PMT is any money that is paid in or withdrawn during the investment.

Note that in the IB examination payments will always be made at the end of the period. So make sure you have Payment:END.

Note that in all examples so far we've set PMT = 0 as there were no payments made during the investment.

PMT is any money that is paid in or withdrawn during the investment.

Note that in the IB examination payments will always be made at the end of the period. So make sure you have Payment:END.

Tomasz invests 100 000 PLN into savings account that pays 3% annual interest compounded monthly. At the end of each month he withdraws 1500 PLN from his account. Calculate how much money does he have on his account after 4 years.

Tomasz invests 100 000 PLN into savings account that pays 3% annual interest compounded monthly. At the end of each month he withdraws 1500 PLN from his account. Calculate how much money does he have on his account after 4 years.

Here we will go directly to TVM.

We have:

```
n = 48 (we have 48 months in 4 years)
```

$$1\% = 3$$
 (annual interest rate)

$$PV = -100000$$
 (must be negative)

$$^{
m PMT} = 1500$$
 (must be positive, he gets this money)

$$FV = ? (unknown)$$

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 12$$
 (compounded 12 times per year)

And we get FV = 36335.99

19 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

```
We have:

n=48 (we have 48 months in 4 years)

I\%=3 (annual interest rate)

PV=-100000 (must be negative)

PMT=1500 (must be positive, he gets this money)

FV=? (unknown)

P/Y=12 (12 payments per year)

C/Y=12 (compounded 12 times per year)
```

And we get FV = 36335.99.

```
We have:
   n = 48 (we have 48 months in 4 years)
  1\% = 3 (annual interest rate)
 PV = -100000 (must be negative)
PMT = 1500 (must be positive, he gets this money)
 FV = ? (unknown)
P/Y = 12 (12 payments per year)
C/Y = 12 (compounded 12 times per year)
 And we get FV = 36335.99.
```

Tomasz invests 50 000 PLN into savings account that pays 2.2% annual interest compounded quarterly. At the end of each quarter he puts another 5000 PLN into his account. Calculate how much money he has on his account after 5 years.

We will use TVM. Note that this time PMT will be negative, since he puts the money into the account.

Tomasz invests 50 000 PLN into savings account that pays 2.2% annual interest compounded quarterly. At the end of each quarter he puts another 5000 PLN into his account. Calculate how much money he has on his account after 5 years.

We will use TVM. Note that this time PMT will be negative, since he puts the money into the account.

We should input:

```
n = 20 (we have 20 quarters in 5 years)
```

$$1\% = 2.2$$
 (annual interest rate)

$$PV = -50000$$
 (must be negative)

2
MT $\,=\,-5000$ (negative, he invests the money)

$$FV = ? (unknown)$$

$$P/Y = 4$$
 (4 payments per year)

$$C/Y = 4$$
 (compounded 4 times per year)

We get FV=161198.61

21 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

```
We should input:

n=20 (we have 20 quarters in 5 years)

I\%=2.2 (annual interest rate)

PV=-50000 (must be negative)

PMT=-5000 (negative, he invests the money)

FV=? (unknown)

P/Y=4 (4 payments per year)

C/Y=4 (compounded 4 times per year)
```

We get FV = 161198.61

```
We should input:
   n = 20 (we have 20 quarters in 5 years)
  1\% = 2.2 (annual interest rate)
 PV = -50000 (must be negative)
PMT = -5000 (negative, he invests the money)
 FV = ? (unknown)
P/Y = 4 (4 payments per year)
C/Y = 4 (compounded 4 times per year)
 We get FV = 161198.61.
```

Let's do the second example algebraically too. The annual interest is 2.2%, so we get 0.55% each quarter.

Let's do the second example algebraically too. The annual interest is 2.2%, so we get 0.55% each quarter. After the first quarter we should get:

$$FV = 50000 \cdot 1.0055 + 5000$$

Let's do the second example algebraically too. The annual interest is 2.2%, so we get 0.55% each quarter. After the first quarter we should get:

$$FV = 50000 \cdot 1.0055 + 5000$$

After the second quarter:

$$FV = (50000 \cdot 1.0055 + 5000) \cdot 1.0055 + 5000$$

Let's do the second example algebraically too. The annual interest is 2.2%, so we get 0.55% each quarter. After the first quarter we should get:

$$FV = 50000 \cdot 1.0055 + 5000$$

After the second quarter:

$$FV = (50000 \cdot 1.0055 + 5000) \cdot 1.0055 + 5000$$

We could continue this way or note that the initial 50000 stays in the account for the full 20 quarters, the first payment of 5000 is in the account for 19 quarters, the second payment for 18 quarters etc. This gives us:

$$FV = 50000 \cdot 1.0055^{20} + 5000 \cdot 1.0055^{20} + 5000 \cdot 1.0055^{19} + 5000 \cdot 1.0055^{18} + \dots + 5000 \cdot 1.0055^{1} + 5000$$

We get $50000 \cdot 1.0055^{20}$ plus a geometric series with first term 5000, ratio 1.0055 and 20 terms, so:

$$FV = 50000 \cdot 1.0055^{20} + \frac{5000(1.0055^{20} - 1)}{1.0055 - 1} = 161198.61$$

Let's use yet another method.

Let's set up a recurrence. Here (unlike in most cases) it is good to start with a_0 rather than a_1 (because a_n will represent the value after n quarters, so a_0 , not a_1 , represents the initial investment). The recurrence is $a_n = a_{n-1} \cdot 1.0055 + 5000$ and $a_0 = 5000$. We are looking for a_{20} . You should get the same answer as we did with the previous methods.

Tomasz Lechowski DP1 AI HL September 16, 2023 24 / 43

Let's use yet another method. Recurrences!

Let's set up a recurrence. Here (unlike in most cases) it is good to start with a_0 rather than a_1 (because a_n will represent the value after n quarters, so a_0 , not a_1 , represents the initial investment). The recurrence is $a_n = a_{n-1} \cdot 1.0055 + 5000$ and $a_0 = 5000$. We are looking for a_{20} . You should get the same answer as we did with the previous methods.

Let's use yet another method. Recurrences!

Let's set up a recurrence. Here (unlike in most cases) it is good to start with a_0 rather than a_1 (because a_n will represent the value after nquarters, so a_0 , not a_1 , represents the initial investment). The recurrence is $a_n = a_{n-1} \cdot 1.0055 + 5000$ and $a_0 = 5000$. We are looking for a_{20} .

Let's use yet another method. Recurrences!

Let's set up a recurrence. Tomasz takes a loan of 120 000PLN. The loan is to be repaid in 20 years with equal monthly payments. The annual interest on the loan is 4.5% compounded monthly. Calculate the monthly repayments.

Again we will use TVM

Tomasz takes a loan of 120 000PLN. The loan is to be repaid in 20 years with equal monthly payments. The annual interest on the loan is 4.5% compounded monthly. Calculate the monthly repayments.

Again we will use TVM.

We have:

- n = 240 (we have 240 months in 20 years)
- 1% = 4.5 (annual interest rate)
- $PV = 120\,000$ (this time it's positive as we get this money)
- PMT = ? (we want to calculate the repayments, they will be negative)
 - FV = 0 (the loan needs to be repaid)
- P/Y = 12 (12 payments per year)
- C/Y = 12 (compounded 12 times per year)

And we get PMT = -759.18. So Tomasz needs to pay 759.18 PLN permonth to repay his loan in 20 years.

26 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

```
We have:
```

```
n = 240 (we have 240 months in 20 years)
```

1% = 4.5 (annual interest rate)

 $PV = 120\ 000$ (this time it's positive as we get this money)

PMT = ? (we want to calculate the repayments, they will be negative)

FV = 0 (the loan needs to be repaid)

P/Y = 12 (12 payments per year)

C/Y = 12 (compounded 12 times per year)

And we get PMT = -759.18. So Tomasz needs to pay 759.18 PLN permonth to repay his loan in 20 years.

Loans

We have:

- n = 240 (we have 240 months in 20 years)
- 1% = 4.5 (annual interest rate)
- $PV = 120\ 000$ (this time it's positive as we get this money)
- PMT = ? (we want to calculate the repayments, they will be negative)
 - FV = 0 (the loan needs to be repaid)
 - P/Y = 12 (12 payments per year)
 - C/Y = 12 (compounded 12 times per year)

And we get PMT = -759.18. So Tomasz needs to pay 759.18 PLN per month to repay his loan in 20 years.

Tomasz invests 150 000 PLN into an annuity that pays a fixed amount of money per month. The annual interest on the annuity is 1.5\$ and it is compounded monthly. Calculate how much money can Tomasz receive each month, if the annuity is to last for 15 year.

TVM on the next slide.

Our inputs:

- $n\,=\,180$ (we have 180 months in 15 years)
- 1% = 1.5 (annual interest rate)
- $PV = -150\,000$ (negative, he invests it)
- PMT = ? (should be positive, as he gets this money)
 - FV = 0 (no more money on the investment)
- P/Y = 12 (12 payments per year)
- ${\sf C/Y}\,=12$ (compounded 12 times per year)
- And we get PMT = 931.11. Tomasz can withdraw 931.11 PLN each month for 15 years.

28 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

Our inputs:

```
n = 180 (we have 180 months in 15 years)
```

$$1\% = 1.5$$
 (annual interest rate)

$$PV = -150\ 000$$
 (negative, he invests it)

$$PMT = ?$$
 (should be positive, as he gets this money)

$$FV = 0$$
 (no more money on the investment)

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 12$$
 (compounded 12 times per year)

And we get PMT=931.11. Tomasz can withdraw 931.11 PLN each month for 15 years.

Our inputs:

```
n = 180 (we have 180 months in 15 years)
```

$$1\% = 1.5$$
 (annual interest rate)

$$PV = -150\ 000$$
 (negative, he invests it)

$$PMT = ?$$
 (should be positive, as he gets this money)

$$FV = 0$$
 (no more money on the investment)

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 12$$
 (compounded 12 times per year)

And we get PMT = 931.11. Tomasz can withdraw 931.11 PLN each month for 15 years.

Now we move on to some more complicated examples. These are the types of examples you may expect to appear on the exam.

Quick note on writing out the solution. If you use TVM on GDC, then a your solution you should write down your GDC input (n=...,i%=..., etc.). But make sure you write down the answer explicitly, for example:

Now we move on to some more complicated examples. These are the types of examples you may expect to appear on the exam.

Quick note on writing out the solution. If you use TVM on GDC, then as your solution you should write down your GDC input (n=..., i%=..., etc.).

Now we move on to some more complicated examples. These are the types of examples you may expect to appear on the exam.

Quick note on writing out the solution. If you use TVM on GDC, then as your solution you should write down your GDC input (n=..., i%=..., etc.). But make sure you write down the answer explicitly, for example: "Tomasz needs to invest 666 PLN".

Maria takes a loan of 300 000 PLN. The annual interest on the loan is 3.5% and it is compounded monthly.

- (a) Calculate the monthly repayments if the loan is to be repaid in 20 years.
- (b) Calculate the total interest Maria would pay for her loan.
- (c) After 10 years Maria is able to increase the monthly repayments to 2500 PLN. Calculate how long it will take to repay the whole loan.

Part (a) is easy:

And we get PMT = -1739.88. Maria needs to pay 1739.88 PLN each month to repay her loan in 20 years

31 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

```
Part (a) is easy:

n=240 (we have 240 months in 20 years)

I\%=3.5 (annual interest rate)

PV=300\ 000 (positive, she gets this money)

PMT=? (should be negative as she repays it)

FV=0 (loan is repaid)

P/Y=12 (12 payments per year)

C/Y=12 (compounded 12 times per year)
```

And we get PMT = -1739.88. Maria needs to pay 1739.88 PLN each month to repay her loan in 20 years

```
Part (a) is easy:

n=240 (we have 240 months in 20 years)

I\%=3.5 (annual interest rate)

PV=300\ 000 (positive, she gets this money)

PMT=? (should be negative as she repays it)

FV=0 (loan is repaid)

P/Y=12 (12 payments per year)
```

C/Y = 12 (compounded 12 times per year)

And we get PMT = -1739.88. Maria needs to pay 1739.88 PLN each month to repay her loan in 20 years.

In part (b) we first need to calculate how much she paid back. She paid 1739.88 per month for 240 months. So she paid a total of

$$1739.88 \cdot 240 = 417571.2$$

The loan was 300 000, so the total interest was:

Tomasz Lechowski DP1 Al HL September 16, 2023 32 / 43

In part (b) we first need to calculate how much she paid back. She paid 1739.88 per month for 240 months. So she paid a total of

$$1739.88 \cdot 240 = 417571.2$$

The loan was 300 000, so the total interest was:

$$417571.2 - 300000 = 117571.2$$

Part (c) is done in 2 parts. First we need to see how much she still owes after 10 years:

```
= 120 (we have 120 months in 10 years)
```

```
1\% = 3.5 (annual interest rate)
```

$$^{\prime}$$
MT $\,=-1739.88$ (should be negative as she repays it)

$$FV = ?$$
 (how much she still owes)

$$P/Y = 12$$
 (12 payments per year)

$${\sf C/Y}\,=12$$
 (compounded 12 times per year)

And we get FV = -175948.09. So she still needs to repay 175948.09PLI

Part (c) is done in 2 parts. First we need to see how much she still owes after 10 years:

```
n = 120 (we have 120 months in 10 years)
```

1% = 3.5 (annual interest rate)

 $PV = 300\ 000$ (positive, she gets this money)

PMT = -1739.88 (should be negative as she repays it)

FV = ? (how much she still owes)

P/Y = 12 (12 payments per year)

C/Y = 12 (compounded 12 times per year)

Part (c) is done in 2 parts. First we need to see how much she still owes after 10 years:

```
n = 120 (we have 120 months in 10 years)
```

$$1\% = 3.5$$
 (annual interest rate)

$$PV = 300\ 000$$
 (positive, she gets this money)

$$PMT = -1739.88$$
 (should be negative as she repays it)

FV = ? (how much she still owes)

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 12$$
 (compounded 12 times per year)

And we get FV = -175948.09. So she still needs to repay 175948.09PLN.

Now we increase the payments:

- n = ? (unknown number of months)
- 1% = 3.5 (annual interest rate)
- PV = 175948.09 (positive, she gets this money)
- 2 MT = -2500 (increased repayments)
- FV = 0 (loan is to be repaid)
- P/Y = 12 (12 payments per year)
- $\mathrm{C/Y} = 12$ (compounded 12 times per year)

And we get n = 78.9. So she needs another 79 months to repay the loan The total time to repay the loan is then 199 months (120 \pm 79)

```
Now we increase the payments:
```

```
n = ? (unknown number of months)
```

$$1\% = 3.5$$
 (annual interest rate)

$$PV = 175948.09$$
 (positive, she gets this money)

$$PMT = -2500$$
 (increased repayments)

$$FV = 0$$
 (loan is to be repaid)

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 12$$
 (compounded 12 times per year)

And we get n = 78.9. So she needs another 79 months to repay the loan. The total time to repay the loan is then 199 months (120 + 79).

Now we increase the payments:

```
n = ? (unknown number of months)
```

$$1\% = 3.5$$
 (annual interest rate)

$$PV = 175948.09$$
 (positive, she gets this money)

$$PMT = -2500$$
 (increased repayments)

$$FV = 0$$
 (loan is to be repaid)

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 12$$
 (compounded 12 times per year)

And we get n = 78.9. So she needs another 79 months to repay the loan. The total time to repay the loan is then 199 months (120 + 79).

Maria invests 50 000 PLN into savings accounts that pays 1.5% annual interest rate compounded monthly. Additional she puts another 1000 PLN into the account at the end of each month. Tomasz also invests a certain sum into a savings account that pays 1.6% annual interest rate compounded quarterly. He makes no further payments into the account. Calculate how much he needs to invest to have the same amount of money in the account in 5 years.

Maria invests 50 000 PLN into savings accounts that pays 1.5% annual interest rate compounded monthly. Additional she puts another 1000 PLN into the account at the end of each month. Tomasz also invests a certain sum into a savings account that pays 1.6% annual interest rate compounded quarterly. He makes no further payments into the account. Calculate how much he needs to invest to have the same amount of money in the account in 5 years.

We will do this in two parts. First we will calculate the amount in Maria's account in 5 years.

We input:

```
n = 60 (60 \text{ months in 5 years})
```

$$1\% = 1.5$$
 (annual interest rate)

$$PV = -50000$$
 (negative, she invests this)

PMT
$$=-1000$$
 (also negative)

$$FV = ? (unknown)$$

$${\sf P}/{\sf Y}\,=12$$
 (12 payments per year)

$${\sf C}/{\sf Y}=12$$
 (compounded 12 times per year)

And we get FV = 116158.62.

```
We input:

n = 60 (60 \text{ months in 5 years})

I\% = 1.5 (\text{annual interest rate})

PV = -50000 (\text{negative, she invests this})

PMT = -1000 (\text{also negative})

FV = ? (\text{unknown})

P/Y = 12 (12 \text{ payments per year})

C/Y = 12 (\text{compounded } 12 \text{ times per year})
```

And we get FV = 116158.62.

```
We input:
```

```
n = 60 (60 months in 5 years)
```

$$1\% = 1.5$$
 (annual interest rate)

$$PV = -50000$$
 (negative, she invests this)

$$PMT = -1000$$
 (also negative)

$$FV = ? (unknown)$$

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 12$$
 (compounded 12 times per year)

And we get
$$FV = 116158.62$$
.

Now we look at Tomasz:

- n = 60 (60 months in 5 years)
- 1% = 1.6 (annual interest rate)
- PV = ? (unknown, will be negative)
- PMT = 0 (no payments)
- FV = 116158.6181 (what Maria should have)
- P/Y = 4 (4 periods per year)
- C/Y = 4 (compounded 4 times per year)

And we get PV = -91417.36. Tomasz needs to invest 91417.36 PLN to have the same amount as Maria in 5 years.

```
Now we look at Tomasz:
```

```
n = 60 (60 months in 5 years)
```

$$1\% = 1.6$$
 (annual interest rate)

$$PV = ?$$
 (unknown, will be negative)

$$PMT = 0$$
 (no payments)

$$P/Y = 4$$
 (4 periods per year)

$$C/Y = 4$$
 (compounded 4 times per year)

And we get PV = -91417.36. Tomasz needs to invest 91417.36 PLN to have the same amount as Maria in 5 years.

Now we look at Tomasz:

```
n = 60 (60 months in 5 years)
```

$$1\% = 1.6$$
 (annual interest rate)

$$PV = ?$$
 (unknown, will be negative)

$$PMT = 0$$
 (no payments)

$$FV = 116158.6181$$
 (what Maria should have)

$$P/Y = 4$$
 (4 periods per year)

$$C/Y = 4$$
 (compounded 4 times per year)

And we get PV = -91417.36. Tomasz needs to invest 91417.36 PLN to have the same amount as Maria in 5 years.

Tomasz takes a loan of 200 000 PLN. The interest on the loan is 3.2% compounded quarterly. The loan is to be repaid in monthly payments of 1477.74 PLN per month.

- (a) How long does it take to repay the loan?
- (b) Calculate the total interest on the loan.
- (b) After 5 years the bank decreases the interest on the loan to 3% how much quicker will Tomasz repay his loan given that the repayments are not changed?

This is an unusual question, because $P/Y \neq C/Y$. Compounding are quarterly, but the payments are monthly.

Tomasz takes a loan of 200 000 PLN. The interest on the loan is 3.2% compounded quarterly. The loan is to be repaid in monthly payments of 1477.74 PLN per month.

- (a) How long does it take to repay the loan?
- (b) Calculate the total interest on the loan.
- (b) After 5 years the bank decreases the interest on the loan to 3% how much quicker will Tomasz repay his loan given that the repayments are not changed?

This is an unusual question, because $P/Y \neq C/Y$. Compounding are quarterly, but the payments are monthly.

Our input:

```
n = ? (unknown number of months)
```

$$1\% = 3.2$$
 (annual interest rate)

$$PV = 200~000$$
 (positive, he gets the money)

$$^{
m PMT} = -1477.74$$
 (negative, he gives the money back)

$$FV = 0$$
 (loan is repaid)

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 4$$
 (compounded 4 times per year)

And we get n=168. So the loan will be repaid in 168 months or 14 years

39 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

Our input:

```
n = ? (unknown number of months) 

I\% = 3.2 (annual interest rate) 

PV = 200\ 000 (positive, he gets the money) 

PMT = -1477.74 (negative, he gives the money back) 

FV = 0 (loan is repaid) 

P/Y = 12 (12 payments per year)
```

C/Y = 4 (compounded 4 times per year)

Our input:

```
n = ? (unknown number of months)

I\% = 3.2 (annual interest rate)

PV = 200\ 000 (positive, he gets the money)

PMT = -1477.74 (negative, he gives the money back)

FV = 0 (loan is repaid)

P/Y = 12 (12 payments per year)

C/Y = 4 (compounded 4 times per year)
```

And we get n = 168. So the loan will be repaid in 168 months or 14 years.

Total interest is:

 $168 \cdot 1477.74 - 200000 = 48260.32$

Because he pays 1477.74 PLN for 168 months for a loan of $200\,\,000$ PLN

40 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

Total interest is:

$$168 \cdot 1477.74 - 200000 = 48260.32$$

Because he pays 1477.74 PLN for 168 months for a loan of 200 000 PLN.

We first calculate how much he still owes after 5 years:

- n = 60 (60 months in 5 years)
- 1% = 3.2 (annual interest rate)
- PV = 200~000 (positive, he gets the money)
- $^{
 m PMT} = -1477.74$ (negative, he gives the money back)
 - FV = ? (unknown)
- $\mathrm{P/Y} = 12$ (12 payments per year).
- C/Y = 4 (compounded 4 times per year)

And we get FV = -138560.3338.

41 / 43

Tomasz Lechowski DP1 AI HL September 16, 2023

We first calculate how much he still owes after 5 years:

```
n = 60 (60 months in 5 years)
```

$$1\% = 3.2$$
 (annual interest rate)

$$PV = 200\ 000$$
 (positive, he gets the money)

PMT =
$$-1477.74$$
 (negative, he gives the money back)

$$FV = ? (unknown)$$

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 4$$
 (compounded 4 times per year)

We first calculate how much he still owes after 5 years:

```
n = 60 (60 months in 5 years)
```

$$1\% = 3.2$$
 (annual interest rate)

$$PV = 200\ 000$$
 (positive, he gets the money)

PMT =
$$-1477.74$$
 (negative, he gives the money back)

$$FV = ? (unknown)$$

$$P/Y = 12$$
 (12 payments per year)

$$C/Y = 4$$
 (compounded 4 times per year)

And we get
$$FV = -138560.3338$$
.

Now we decrease the interest rate:

- n = ? (unknown)
- 1% = 3 (new interest rate)
- PV = 138560.3338 (he still owes this)
- $^{
 m PMT} = -1477.74$ (repayments are not changed)
 - FV = 0 (loan is repaid)
- P/Y = 12 (12 payments per year)
- C/Y = 4 (compounded 4 times per year)

And we get n = 107. So the loan takes a total of 167 months to be repaid. He repays it only one month earlier

Now we decrease the interest rate:

```
n = ? (unknown)
1\% = 3 (new interest rate)
```

PV = 138560.3338 (he still owes this)

 $\mathsf{PMT} = -1477.74 \; (\mathsf{repayments} \; \mathsf{are} \; \mathsf{not} \; \mathsf{changed})$

FV = 0 (loan is repaid)

P/Y = 12 (12 payments per year)

C/Y = 4 (compounded 4 times per year)

And we get n = 107. So the loan takes a total of 167 months to be repaid. He repays it only one month earlier.

Now we decrease the interest rate:

```
n = ? (unknown)
```

1% = 3 (new interest rate)

PV = 138560.3338 (he still owes this)

PMT = -1477.74 (repayments are not changed)

FV = 0 (loan is repaid)

P/Y = 12 (12 payments per year)

C/Y = 4 (compounded 4 times per year)

And we get n = 107. So the loan takes a total of 167 months to be repaid. He repays it only one month earlier.

In case of any questions you can email me at t.j.lechowski@gmail.com or message me via Librus or MS Teams.
