Trig modelling - exam questions [60 marks]

1. [Maximum mark: 7] EXN.1.SL.TZ0.6 The size of the population (P) of migrating birds in a particular town can be approximately modelled by the equation $P = a \sin(bt) + c, \ a, b, c \in \mathbb{R}^+$, where t is measured in months from the time of the initial measurements.

In a 12 month period the maximum population is 2600 and occurs when t=3 and the minimum population is 800 and occurs when t=9.

This information is shown on the graph below.

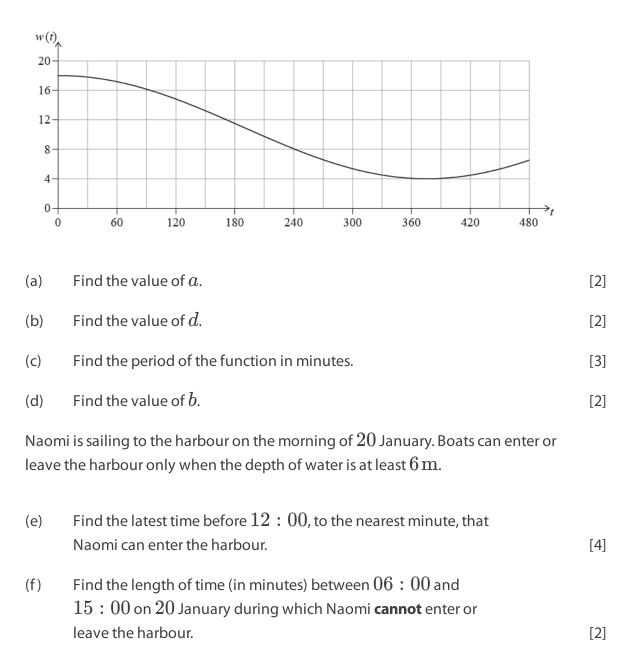

(a.i)	Find the value of <i>a</i> .	[2]
(a.ii)	Find the value of <i>b</i> .	[2]
(a.iii)	Find the value of <i>c</i> .	[1]
(b)	Find the value of t at which the population first reaches $2200.$	[2]

2. [Maximum mark: 15]

The depth of water, w metres, in a particular harbour can be modelled by the function $w(t) = a \cos{(bt^{\circ})} + d$ where t is the length of time, in minutes, after 06:00.

On 20 January, the first high tide occurs at 06:00, at which time the depth of water is $18 \, m$. The following low tide occurs at 12:15 when the depth of water is $4 \, m$. This is shown in the diagram.

3. [Maximum mark: 6]

[1]

A cat runs inside a circular exercise wheel, making the wheel spin at a constant rate in an anticlockwise direction. The height, $h \, \mathrm{cm}$, of a fixed point, P , on the wheel can be modelled by $h(t) = a \, \sin(bt) + c$ where t is the time in seconds and $a, \ b, \ c \in \mathbb{R}^+$.

When t=0, point P is at a height of $78\,\mathrm{cm}$.

Write down the new value of *b*.

(d)

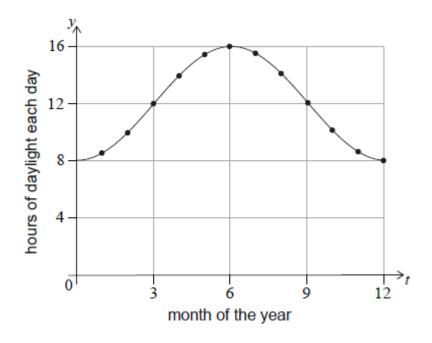

(a)	Write down the value of <i>c</i> .	[1]
When	$t=4$, point ${ m P}$ first reaches its maximum height of $143{ m cm}$.	
(b.i)	Find the value of <i>a</i> .	[1]
(b.ii)	Find the value of <i>b</i> .	[2]
(c)	Write down the minimum height of point ${f P}.$	[1]
Later, the cat is tired, and it takes twice as long for point ${f P}$ to complete one revolution at a new constant rate.		

[1]

4. [Maximum mark: 15]

Boris recorded the number of daylight hours on the first day of each month in a northern hemisphere town.

This data was plotted onto a scatter diagram. The points were then joined by a smooth curve, with minimum point $(0,\ 8)$ and maximum point $(6,\ 16)$ as shown in the following diagram.

Let the curve in the diagram be y=f(t), where t is the time, measured in months, since Boris first recorded these values.

Boris thinks that f(t) might be modelled by a quadratic function.

 Write down one reason why a quadratic function would not be a good model for the number of hours of daylight per day, across a number of years.

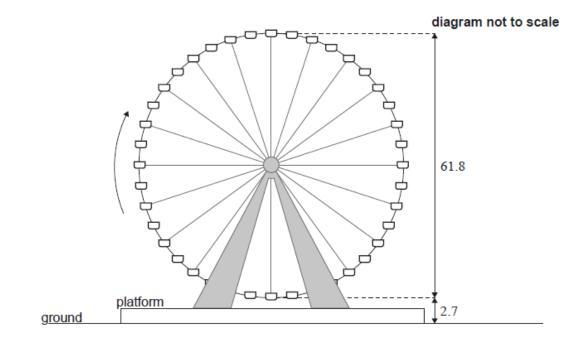

Paula thinks that a better model is $f(t) = a\,\cos(bt) + d$, $t \geq 0$, for specific values of $a,\ b$ and d.

For Paula's model, use the diagram to write down

(b.i)	the amplitude.	[1]
(b.ii)	the period.	[1]
(b.iii)	the equation of the principal axis.	[2]
(c)	Hence or otherwise find the equation of this model in the form:	
	$f(t) = a\cos(bt) + d$	[3]
(d)	For the first year of the model, find the length of time when there are more than 10 hours and 30 minutes of daylight per day.	[4]
The true maximum number of daylight hours was 16 hours and 14 minutes.		
(e)	Calculate the percentage error in the maximum number of daylight hours Boris recorded in the diagram.	[3]

5. [Maximum mark: 17]

The Texas Star is a Ferris wheel at the state fair in Dallas. The Ferris wheel has a diameter of $61.8 \,\mathrm{m}$. To begin the ride, a passenger gets into a chair at the lowest point on the wheel, which is $2.7 \,\mathrm{m}$ above the ground, as shown in the following diagram. A ride consists of multiple revolutions, and the Ferris wheel makes 1.5 revolutions per minute.

The height of a chair above the ground, h, measured in metres, during a ride on the Ferris wheel can be modelled by the function $h(t) = -a \cos(bt) + d$, where t is the time, in seconds, since a passenger began their ride.

Calculate the value of

- (a.i) *a*. [2]
- (a.ii) *b*. [2]
- (a.iii) *d*. [2]

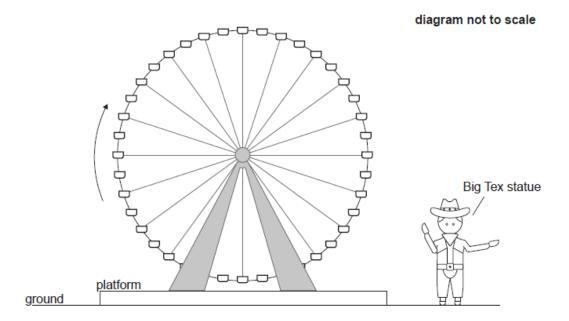

A ride on the Ferris wheel lasts for 12 minutes in total.

(b) Calculate the number of revolutions of the Ferris wheel per ride. [2]

For exactly one ride on the Ferris wheel, suggest

- (c.i) an appropriate domain for h(t). [1]
- (c.ii) an appropriate range for h(t). [2]

Big Tex is a 16.7 metre-tall cowboy statue that stands on the horizontal ground next to the Ferris wheel.

(d) By considering the graph of h(t), determine the length of time during one revolution of the Ferris wheel for which the chair is higher than the cowboy statue.

There is a plan to relocate the Texas Star Ferris wheel onto a taller platform which will increase the maximum height of the Ferris wheel to $65.2 \,\mathrm{m}$. This will change the value of one parameter, a, b or d, found in part (a).

[3]

(e.i)	Identify which parameter will change.	[1]
(e.ii)	Find the new value of the parameter identified in part (e)(i).	[2]
