Logarithms part 2

Introduction

Let's start with the simple equation:

$$\log_2 8 = 3$$

This is true because:

$$2^3 = 8$$

Introduction

Let's start with the simple equation:

$$\log_2 8 = 3$$

This is true because:

$$2^3 = 8$$

In general we have $\log_a b = c$ if and only if $a^c = b$, with the restriction that a and b have to be positive real numbers and $a \neq 1$.

Simple equations

This already allows us to solve a lot of simple logarithmic equations.

Simple equations

This already allows us to solve a lot of simple logarithmic equations. For example:

$$\log_3(x-2) = 4$$

Simple equations

This already allows us to solve a lot of simple logarithmic equations. For example:

$$\log_3(x-2) = 4$$

By definition we get that:

$$3^4 = x - 2$$

So $x = 83$.

Simple equations

Always remember to check the answers you get.

Simple equations

Always remember to check the answers you get. Consider the equation:

$$\log_x 16 = 2$$

Simple equations

Always remember to check the answers you get. Consider the equation:

$$\log_x 16 = 2$$

We get that:

$$x^2 = 16$$

Simple equations

Always remember to check the answers you get. Consider the equation:

$$\log_x 16 = 2$$

We get that:

$$x^2 = 16$$

So $x = 4$ or $x = -4$, but the base of the logarithm cannot be negative, so finally we have only one solution $x = 4$.

Simple equations - practice

a) $\log_5(2x+3)=2$

Simple equations - practice

a) $\log_5(2x+3)=2$

$2x+3=5^2$, so $x=11$.

b) $\log_{x-2} 27=3$

Simple equations - practice

a) $\log_5(2x+3) = 2$

$2x + 3 = 5^2$, so $x = 11$.

b) $\log_{x-2} 27 = 3$

$(x-2)^3 = 27$, so $x = 5$.

c) $\log_4 \frac{1}{8} = x + 2$

Simple equations - practice

a) $\log_5(2x+3) = 2$

$2x+3 = 5^2$, so $x = 11$.

b) $\log_{x-2} 27 = 3$

$(x-2)^3 = 27$, so $x = 5$.

c) $\log_4 \frac{1}{8} = x+2$

$4^{x+2} = \frac{1}{8}$, so $x = -\frac{7}{2}$.

Simple equations - practice

a) $\log_{\sqrt{2}}(3x-1)=8$

Simple equations - practice

a) $\log_{\sqrt{2}}(3x-1)=8$

$3x-1=(\sqrt{2})^8$, so $x=\frac{17}{3}$.

b) $\log_{2x+1}81=625$

Simple equations - practice

a) $\log_{\sqrt{2}}(3x-1) = 8$

$3x - 1 = (\sqrt{2})^8$, so $x = \frac{17}{3}$.

b) $\log_{2x+1} 81 = 625$

$(2x+1)^4 = 625$, so $x = 2$.

c) $\log_9 \sqrt{3} = 2x - 3$

Simple equations - practice

a) $\log_{\sqrt{2}}(3x-1)=8$

$3x-1=(\sqrt{2})^8$, so $x=\frac{17}{3}$.

b) $\log_{2x+1}81=625$

$(2x+1)^4=625$, so $x=2$.

c) $\log_9\sqrt{3}=2x-3$

$9^{2x-3}=\sqrt{3}$, so $x=\frac{13}{8}$.

Properties of logarithms

More complicated equations require the use of the properties of logarithms. The three basic rules we will be using are:

1. $\log_a b + \log_a c = \log_a(bc)$

Properties of logarithms

More complicated equations require the use of the properties of logarithms. The three basic rules we will be using are:

1. $\log_a b + \log_a c = \log_a(bc)$

   Example $\log_6 4 + \log_6 9 = \log_6 36 = 2$

Properties of logarithms

More complicated equations require the use of the properties of logarithms. The three basic rules we will be using are:

1. $\log_a b + \log_a c = \log_a(bc)$

   Example $\log_6 4 + \log_6 9 = \log_6 36 = 2$

2. $\log_a b - \log_a c = \log_a \left(\frac{b}{c}\right)$

Properties of logarithms

More complicated equations require the use of the properties of logarithms. The three basic rules we will be using are:

1. $\log_a b + \log_a c = \log_a(bc)$

   Example $\log_6 4 + \log_6 9 = \log_6 36 = 2$

2. $\log_a b - \log_a c = \log_a \left(\frac{b}{c}\right)$

   Example $\log_5 1000 + \log_5 8 = \log_5 125 = 3$

Properties of logarithms

More complicated equations require the use of the properties of logarithms. The three basic rules we will be using are:

1. $\log_a b + \log_a c = \log_a(bc)$

   Example $\log_6 4 + \log_6 9 = \log_6 36 = 2$

2. $\log_a b - \log_a c = \log_a\left(\frac{b}{c}\right)$

   Example $\log_5 1000 + \log_5 8 = \log_5 125 = 3$

3. $k \log_a b = \log_a(b^k)$

Properties of logarithms

More complicated equations require the use of the properties of logarithms. The three basic rules we will be using are:

1. $\log_a b + \log_a c = \log_a(bc)$

   Example $\log_6 4 + \log_6 9 = \log_6 36 = 2$

2. $\log_a b - \log_a c = \log_a \left(\frac{b}{c}\right)$

   Example $\log_5 1000 + \log_5 8 = \log_5 125 = 3$

3. $k \log_a b = \log_a(b^k)$

   Example $\log_2(2^{10}) = 10 \log_2 2 = 10$

Equations - example 1

Consider the equation:

$$\log_2(x+1) - \log_2(x-1) = 3$$

Equations - example 1

Consider the equation:

$$\log_2(x+1) - \log_2(x-1) = 3$$

Using the second property we can rearrange the equation to:

$$\log_2\left(\frac{x+1}{x-1}\right) = 3$$

Equations - example 1

Consider the equation:

$$\log_2(x+1) - \log_2(x-1) = 3$$

Using the second property we can rearrange the equation to:

$$\log_2\left(\frac{x+1}{x-1}\right) = 3$$

Now we can use the definition of logarithm to get:

$$\frac{x+1}{x-1} = 2^3$$

Equations - example 1

Consider the equation:

$$\log_2(x+1) - \log_2(x-1) = 3$$

Using the second property we can rearrange the equation to:

$$\log_2\left(\frac{x+1}{x-1}\right) = 3$$

Now we can use the definition of logarithm to get:

$$\frac{x+1}{x-1} = 2^3$$

Which gives $x + 1 = 8x - 8$, so we get that $x = \frac{9}{7}$.

Equations - example 2

Now consider a slightly different equation:

$$\log_2(x-1)-\log_2(x+1)=3$$

Equations - example 2

Now consider a slightly different equation:

$$\log_2(x-1) - \log_2(x+1) = 3$$

Again we use the second property:

$$\log_2\left(\frac{x-1}{x+1}\right) = 3$$

Equations - example 2

Now consider a slightly different equation:

$$\log_2(x-1) - \log_2(x+1) = 3$$

Again we use the second property:

$$\log_2\left(\frac{x-1}{x+1}\right) = 3$$

And using the definition of logarithm to get:

$$\frac{x-1}{x+1} = 2^3$$

Equations - example 2

Now consider a slightly different equation:

$$\log_2(x-1) - \log_2(x+1) = 3$$

Again we use the second property:

$$\log_2\left(\frac{x-1}{x+1}\right) = 3$$

And using the definition of logarithm to get:

$$\frac{x-1}{x+1} = 2^3$$

Which gives $x-1 = 8x+8$ and we get that $x = -\frac{9}{7}$, but this would mean that we have a negative number inside the logarithm, which is not allowed, so the equation has no solutions.

Equations - example 3

Consider:

$$\log_2 x + \log_2(x+2) = 3$$

Equations - example 3

Consider:

$$\log_2 x + \log_2(x+2) = 3$$

We use the first property:

$$\log_2(x^2 + 2x) = 3$$

Equations - example 3

Consider:

$$\log_2 x + \log_2(x + 2) = 3$$

We use the first property:

$$\log_2(x^2 + 2x) = 3$$

Using the definition of logarithm to get:

$$x^2 + 2x = 2^3$$

Equations - example 3

Consider:

$$\log_2 x + \log_2(x+2) = 3$$

We use the first property:

$$\log_2(x^2 + 2x) = 3$$

Using the definition of logarithm to get:

$$x^2 + 2x = 2^3$$

Which gives $(x+4)(x-2) = 0$ and we get two solutions $x = -4$ and $x = 2$, but $x = -4$ would give us a negative number inside the logarithm, so in the end we have one solution $x = 2$.

Equations - example 4

Now consider:

$$\log_3 \sqrt{x} + \log_3 \sqrt[3]{x} = \frac{5}{3}$$

Equations - example 4

Now consider:

$$\log_3 \sqrt{x} + \log_3 \sqrt[3]{x} = \frac{5}{3}$$

We use the third property to get (remember $\sqrt{x} = x^{\frac{1}{2}}$ and $\sqrt[3]{x} = x^{\frac{1}{3}}$):

$$\frac{1}{2} \log_3 x + \frac{1}{3} \log_3 x = \frac{5}{3}$$

Equations - example 4

Now consider:

$$\log_3 \sqrt{x} + \log_3 \sqrt[3]{x} = \frac{5}{3}$$

We use the third property to get (remember $\sqrt{x} = x^{\frac{1}{2}}$ and $\sqrt[3]{x} = x^{\frac{1}{3}}$):

$$\frac{1}{2}\log_3 x + \frac{1}{3}\log_3 x = \frac{5}{3}$$

Multiplying both sides by 6, adding the logarithms and then dividing by 5 we get:

$$\log_3 x = 2$$

Equations - example 4

Now consider:

$$\log_3 \sqrt{x} + \log_3 \sqrt[3]{x} = \frac{5}{3}$$

We use the third property to get (remember $\sqrt{x} = x^{\frac{1}{2}}$ and $\sqrt[3]{x} = x^{\frac{1}{3}}$):

$$\frac{1}{2}\log_3 x + \frac{1}{3}\log_3 x = \frac{5}{3}$$

Multiplying both sides by 6, adding the logarithms and then dividing by 5 we get:

$$\log_3 x = 2$$

Which gives $x = 3^2$, so $x = 9$.

Practice questions

Next slide contains practice questions. Try them yourselves first, before checking the answers.

Practice questions

a) $\log_{16} x + \log_{16}(x - 3) = \frac{1}{2}$

Practice questions

a) $\log_{16} x + \log_{16}(x-3) = \frac{1}{2}$

We get the equation $x^2 - 3x = 4$, which has two solutions, but only $x = 4$ is correct.

Practice questions

a) $\log_{16} x + \log_{16}(x-3) = \frac{1}{2}$

We get the equation $x^2 - 3x = 4$, which has two solutions, but only $x = 4$ is correct.

b) $\log_5 4x - \log_5(1-x) = -1$

Practice questions

a) $\log_{16} x + \log_{16}(x-3) = \frac{1}{2}$

We get the equation $x^2 - 3x = 4$, which has two solutions, but only $x = 4$ is correct.

b) $\log_5 4x - \log_5(1-x) = -1$

We get the equation $\frac{4x}{1-x} = \frac{1}{5}$, which gives $x = \frac{1}{21}$.

Practice questions

a) $\log_{16} x + \log_{16}(x-3) = \frac{1}{2}$

We get the equation $x^2 - 3x = 4$, which has two solutions, but only $x = 4$ is correct.

b) $\log_5 4x - \log_5(1-x) = -1$

We get the equation $\frac{4x}{1-x} = \frac{1}{5}$, which gives $x = \frac{1}{21}$.

c) $\log_2 x^3 - \log_2 \sqrt[3]{x^2} = 14$

Practice questions

a) $\log_{16} x + \log_{16}(x-3) = \frac{1}{2}$

We get the equation $x^2 - 3x = 4$, which has two solutions, but only $x = 4$ is correct.

b) $\log_5 4x - \log_5(1-x) = -1$

We get the equation $\frac{4x}{1-x} = \frac{1}{5}$, which gives $x = \frac{1}{21}$.

c) $\log_2 x^3 - \log_2 \sqrt[3]{x^2} = 14$

We get $x = 2^6 = 64$.
